I wanted to try out making a proof assistant corresponding to the double category **Rel**.

You have a calculus of "values" corresponding to one edge of **Rel** and a sort of relational calculus of "predicates" corresponding to the other edge. Squares ought to correspond to judgements stating a value satisfies a predicate.

The language of "predicates" is based off the Simply Typed Lambda Calculus (in category theory terms is closed/has exponential objects) and the language of "values" has product types (in category theory terms is Cartesian.)

This is the core framework. I've been thinking about further extensions but I want to see how far I can get characterizing **Rel** with as few language features as possible. Later on I give a few possible extensions.

$$\frac{v_0 \models p \quad [\sigma]}{\mathbf{fst}(v_0, v_1) \models p \quad [\sigma]}$$

$$\frac{v_1 \models p \quad [\sigma]}{\mathbf{snd}(v_0, v_1) \models p \quad [\sigma]}$$

$$\frac{\mathbf{tt} \models p \quad [\sigma]}{v \models \mathbf{fail}(t, p) \quad [\sigma]}$$

$$\frac{v \models [x \leftarrow p_1]p_0 \quad [\sigma]}{v \models (\mu(x \colon t?) \cdot p_0) p_1 \quad [\sigma]}$$

$$\frac{v_1 \models p \quad [\sigma, v_0 \models x]}{(v_0, v_1) \models \mu(x \colon t?) \cdot p \quad [\sigma]}$$

## **Core Calculus**

 $\begin{array}{lll} \textbf{Types} & & & & & & t ::= \top \mid t \times t \\ \textbf{Sorts} & & & s ::= t? \mid t! \\ \textbf{Values} & & v ::= x \mid \mathbf{tt} \mid \mathbf{fst}(v) \mid \mathbf{snd}(v) \mid (v,v) \\ \textbf{Predicates} & & p ::= x \mid \mathbf{fail}(t,p) \mid p \ p \mid \mu(x \colon t?).p \\ \textbf{Environment} & & \Gamma ::= \cdot \mid \Gamma, \ x \colon s \\ \textbf{Substitutions} & & \sigma ::= \cdot \mid \sigma, \ v \models x \end{array}$ 

I need a better name for the abstraction for predicates. It's a little like the  $\mu$  abstraction from the  $\bar{\lambda}\mu\tilde{\mu}$  calculus but different.

Typing judgments.

## **Examples**

Pattern matching on equality

$$(v,v) \models \mu(x\colon t?).x$$

Transposition

$$\mu(p: t \times t \times \top)(x: t)(y: t).pyx$$

$$\begin{array}{l} \overline{\Gamma \vdash \mathbf{tt} \colon \top !} \\ \underline{\Gamma \vdash v \colon t_0 \times t_1 !} \\ \overline{\Gamma \vdash v \colon t_0 \times t_1 !} \\ \overline{\Gamma \vdash \mathbf{fst}(v) \colon t_0 !} \\ \underline{\Gamma \vdash v \colon t_0 \times t_1 !} \\ \overline{\Gamma \vdash \mathbf{snd}(v) \colon t_1 !} \\ \underline{\Gamma \vdash v_0 \colon t_0 !} \quad \overline{\Gamma \vdash v_1 \colon t_1 !} \\ \underline{\Gamma \vdash (v_0, v_1) \colon t_0 \times t_1 !} \\ \underline{\Gamma \vdash p \colon \top ?} \\ \overline{\Gamma \vdash \mathbf{fail}(t, p) \colon t ?} \\ \underline{\Gamma \vdash p_0 \colon t_0 \times t_1 ?} \quad \underline{\Gamma \vdash p_1 \colon t_0 ?} \\ \underline{\Gamma \vdash p_0 \colon t_1 \times t_1 ?} \\ \underline{\Gamma \vdash \mu(x \colon t_0 ?) \colon p \colon t_1 ?} \\ \underline{\Gamma \vdash \mu(x \colon t_0 ?) \colon p \colon t_0 \times t_1 ?} \end{array}$$

When a value satisfies a predicate (I need a better symbol here.)

## **Disjoint Unions**

I am fairly confident in a simple extension to disjoint unions of sets which are sum types in the value calculus and product types in the predicate calculus.

$$\begin{array}{ll} \textbf{Types} & t ::= \dots \mid \bot \mid t + t \\ \textbf{Values} & v ::= \dots \mid \mathbf{absurd}(t,v) \mid \mathbf{inl}(t,v) \mid \\ & \mathbf{inr}(t,v) \mid \mathbf{match} \ v \begin{cases} v & \leftarrow \mathbf{inl}(x) \\ v & \leftarrow \mathbf{inr}(x) \end{cases} \\ \textbf{Predicates} & p ::= \dots \mid \mathbf{false} \mid \mathbf{left}(p) \mid \mathbf{right}(p) \mid \\ [p;p] \end{array}$$

Typing judgments.

$$\begin{array}{lll} & \mathbf{Sorts} & s := \dots \mid *\\ \hline \Gamma \vdash a \mathbf{bsurd}(t,v) : t! & \mathbf{Predicates} & v := \dots \mid tail(v) \mid \langle x \leftarrow t, v \rangle \\ \hline \Gamma \vdash v : t_0! & \mathbf{Predicates} & p := \dots \mid pt \mid \mathbf{M}(x : *).p \\ \hline \Gamma \vdash v : t_1! & \mathbf{Not really good at the typing judgements for dependent sum types.} \\ \hline \hline \Gamma \vdash v_0 : t_0 + t_1! & \mathbf{Predicates} & \mathbf{Predicate$$

**Types** 

Satisfies

I can't figure out satisfaction at all.

 $t ::= \ldots \mid x \mid \mathbf{head}(v) \mid \Sigma(x : *).t$ 

s ::= ... | \*

 $\sigma ::= \ldots \mid \sigma, t \models x$ 

$$\begin{split} & t \models p \quad [\sigma] \\ & \overline{\mathbf{head}(\langle x \leftarrow t, v \rangle)} \models p \quad [\sigma] \\ & \underline{[x \leftarrow t]v \models p \quad [\sigma]} \\ & \overline{\mathbf{tail}(\langle x \leftarrow t, v \rangle)} \models p \quad [\sigma] \\ & \underline{v \models [x \leftarrow t]p \quad [\sigma]} \\ & \underline{v \models (\mathbf{M}(x \colon *).p) t \quad [\sigma]} \\ & \underline{v \models p \quad [\sigma, t \models x]} \\ & \underline{\langle x \leftarrow t, v \rangle} \models \mathbf{M}(x \colon *).p \quad [\sigma] \end{split}$$

## **Dependent Sums**

If product of sets becomes an exponential in the predicate calculus then dependent sums ought to become like  $\Pi$  types. So the predicate calculus effectively becomes like System-F.

Some things become awkward to interpret here though.

I also really can't figure out unpacking. messy if you don't want full dependent types.
